

# INTRODUCTION

As this is a mere slave to client, there are no farther explanations about. Whith a adecuate programmation at client side, the only must be done at device side is to start the process, or closed if the process is canceled.

## **FIRST STEPS**

Once installed the program has no other steps. At runtime, it simply listens to port 27015 to respond to client requests. The implementation of connections to devices is performed by the client program, such as TransTerm

# OPERATIONS

The utility run as a stand-alone process, listening for client requests. In a normal connection procedure, the program support the SEND, RECV, DELETE and QUIT commands. But all programation must be done from client side.

The program use to run in port 27015, but running with the commandline param port, it can listen on any other port (Use /port:nnn).
